

Now that you've learned a little bit about KWS (or been reminded about it if you took the previous courses), how might you scope out the "problem definition" for KWS?

Here is a quick recap of the problem definition process:

- What challenge do you wish to solve?
- How might data science and machine learning approaches be used to solve this problem?
- What data is required for a successful machine learning prototype?
- What could the desired outcomes look like?
- What algorithms do you wish to put to the test?
- What do you make of the model's outputs?
