

Looking Ahead to the Resources You Will Need for Course 3

In Course 3, you will need everything from Course 2, a laptop with a microphone and camera and an internet connection, as well as the course kit as we will be deploying our models onto microcontrollers. You can buy the course kit directly from Arduino at this link:

<https://store.arduino.cc/usa/tiny-machine-learning-kit>

The course kit includes a proprietary shield which will make the camera module much more reliable. However, if you would like to purchase individual components instead of the full kit you will need to purchase the following:

- [Arduino Nano 33 BLE Sense with Headers](#)
- [OV7675 Camera](#)
- Jumper wires and optionally a breadboard for connecting the camera to the arduino

We will also be using the [Arduino IDE](#) during the course and will provide more instructions on the software installation steps in Course 3!
